Tutorial 8 - Constants, Manipulators & Operator Precedence

Constants in C++

- Definition: Constants are variables whose values cannot be changed once initialized.
- · Declared using the const keyword.
- Example:

```
const float a = 3.11;
a = 45.6; // Error: Cannot reassign a constant variable
```

• Error Message: Trying to modify a constant variable results in a compilation error.

Manipulators in C++

- **Definition**: Manipulators are used to format the output in C++.
- Common Manipulators:
 - a. endl: Moves the cursor to a new line.
 - b. setw: Sets the width of the output.
- Example Code:

```
#include <iomanip>
int a = 3, b = 78, c = 1233;

cout << "Without setw:" << endl;

cout << "a = " << a << endl << "b = " << b << endl << "c = " << c << endl;

cout << "\nWith setw (width = 4):" << endl;

cout << "a = " << setw(4) << a << endl;

cout << "b = " << setw(4) << b << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << "c = " << setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout << " < setw(4) << c << endl;

cout <
```

Operator Precedence and Associativity

- Operator Precedence:
 - Determines the order in which operations are performed in an expression.
 - Example:

```
1 int c = a * b + c; // Multiplication (*) is performed before addition (+)
2
```

- Operator Associativity:
 - Determines the order when operators of the same precedence appear together.
 - Most operators follow left-to-right associativity.
 - Example:

```
1 int c = ((((a * 5) + b) - 45) + 87);
2 // * \rightarrow + \rightarrow - \rightarrow +
```

Code Example

```
1 #include <iostream>
2 #include <iomanip>
3 using namespace std;
5 int main() {
     // Constants
7
     const int a = 3;
8
     cout << "Value of a: " << a << endl;
9
     // a = 45; // Uncommenting this will cause an error
10
     // Manipulators
11
12
     int x = 3, y = 78, z = 1233;
13
     cout << "Without setw:" << endl;</pre>
14
       cout << x << " " << y << " " << z << endl;
15
16
       cout << "With setw (width = 4):" << endl;</pre>
       cout << setw(4) << x << " " << setw(4) << y << " " << setw(4) << z << endl;
17
18
19
       // Operator Precedence
20
       int p = 3, q = 4;
21
       int result = ((((p * 5) + q) - 45) + 87);
22
       cout << "Result of expression: " << result << endl;</pre>
23
24
       return 0;
25 }
26
```

Short Notes

Constants

- Use const to declare variables that cannot be modified.
- Example: const int x = 10;

Manipulators

- endl : New line.
- setw: Sets the output width.

Operator Precedence

- Operators like * , / , % have higher precedence than + , .
- · Associativity defines evaluation order when precedence is the same (usually left-to-right).
